AB	The records such as characters, images, and designs are printed with the ink compn. and the reactive soln. on a recording material. The method or the app. comprises processes or devices for depositing the reactive soln. on the recording material, recording images by subsequently depositing the ink compn. , controlling to record the images, and processing the recording material with a polar solvent. The ink compn. contains a colorant, emulsified resin particles, a water sol. org. solvent, and water. The reactive soln. contains a reacting agent forming agglomerates when contacted with the ink compn. , cationic inorg. particles and/or cationic polymer particles, the water sol. org. solvent, and water. The method showed improved image fixability, abrasion resistance, and light stability, and can be printed on various materials such as industrial material, electronic device, food, and cloth.

AB	Title pigment dispersion comprises inorg. pigment and a water-based acrylic emulsion dispersant (used as a grind resin to incorporate inorg. pigment) comprising the reaction product of: (A) an ethylenically unsatd. monomer; (B) a vinylarom. hydrocarbon monomer; (C) a non-functional polyalkylene glycol acrylate or methacrylate monomer, (D) a functional polyalkylene glycol acrylate or methacrylate monomer having a hydroxyl group, and (E) an acid having a first functional acid group reactive with said hydroxyl group, and a second functional acid group capable of providing an acid anion group. Thus, an acrylic emulsion dispersant is manufd. by polymg. Bu methacrylate, Bu acrylate, styrene, Me ether polyethylene glycol methacrylate, and polyethylene glycol methacrylate in the presence of ammonium persulfate, and then reacting with polyphosphoric acid, and finally neutralizing with dimethylethanolamine. Then, the dispersant was mixed with titanium dioxide and other additives in Pr propasol and water to give a pigment dispersion with good glossy appearance.

AB A waterborne base **compn.** comprises an emulsion resin obtained by emulsion polymn. of an .alpha.,.beta.-ethylenically unsatd. monomer mixt. or a water-sol. polyester and 0.01-20% urethane compd. additive contributing to stable viscosity and film smoothness. Thus, an aq. dispersion type acrylic resin 250.0, second water-sol. acrylic resin 32.3, luster color pigment paste C-1 66.3, Cymel 204 25.3, and Adekanol SDX-1014 (urethane, active ingredient content 30%) 1.7 parts were mixed and the mixt. was adjusted to pH 8 by adding a 10% aq. soln. of

- dimethylaminoethanol to give a waterborne base coating **compn.**
The application viscosity of this waterborne base coating (a single cylindrical rotational viscometer at 6 rpm and 25.degree.) was 1100 mPa-s.
- ST pigmented base coat water thinned smoothness

AB	The process comprises emulsion polymn. of ethylenically unsatd. monomer compns. , consisting of poly(alkylene oxide)-bearing monomers and amino-bearing monomers and satisfying amine value .gtoreq.30, in the presence of mol.-wt. controllers and polymn. initiators to give emulsions with Mn .ltoreq.25,000 followed by neutralization with acidic neutralizers. Pigment dispersions comprising the resin compns. and VOC (volatile org. compd.)-minimized waterborne paints contg. the dispersions are also claimed. Thus, a monomer compn. of amine value 80 consisting of styrene, 2-ethylhexyl acrylate, Et acrylate, Me methacrylate, Aqualon RN 10 (decaethoxylated reactive emulsifier), dimethylaminoethyl methacrylate, and Latemul K 180 (cationic reactive emulsifier) was polymd. in the presence of dodecyl mercaptan and VA 061 [2,2'-azobis[2-(2-imidazolin-2-yl)propane]] and neutralized with AcOH to give a transparent resin compn. with Mn 7000, 140 parts of which was mixed with phthalocyanine blue 40, BYK 022 (defoaming agent) 1, and water 19 parts to give a dispersion showing av. particle size <20 .mu.m after 30-day storage at 40.degree.. A blue paint contg. the dispersion and Kanebinol KD 20 (cationic acrylic silicone) formed a glossy paint layer with cross-cut adhesion test 100/100 on a slate.

CC 42-5 (Coatings, Inks, and Related Products)

AB Polymeric **pigment** dispersants are essential for the formulation of high solids and waterborne coatings. New technologies for controlled polymn. play an important role for the development of improved

pigment dispersants. In the last years big progress has been made esp. on nitroxide-mediated controlled free radical polymn., as well as on **atom transfer radical polymn. (ATRP)**. Both techniques overcome limitations of classical polymn. methods and provide an efficient route to functional copolymers with exact control of mol. wt. distribution and mol. architecture. New developed nitroxide polymn. regulators as well as **ATRP** were used for the synthesis of acrylic block copolymers, which are a promising class of dispersants, esp. for difficult to disperse org. **pigments**. On the example of selected **pigments**, it was investigated how structural parameters like chem. **compn.**, block length and mol. wt. influence the dispersant performance. Special attention will be given to the rheol. behavior of **pigment** concs.

AB	The dispersing agent contains a graft copolymer involving a N-contg. repeating unit in the backbone and another repeating unit having .gtoreq.1 functional group selected from amide and acidic group on the grafted segments. The dispersion consists of a pigment, the dispersing agent, and an org. solvent. The colored photosensitive compn. contains the above pigment dispersion, a polyfunctional monomer contg. .gtoreq.2 ethylenic unsatd. groups, and a photopolymn. initiator optionally assocd.				

with an acidic binder polymer. The photosensitive **compn.** showing good alkali-developing property is suitable for color filter in liq. crystal display device, etc.

ST pigment dispersing agent graft copolymer; amide acidic group segment grafted polymer; nitrogen repeating unit backbone graft copolymer; alkali developing property photosensitive pigment **compn**; color filter photolithog **compn** pigment dispersion

OS	MARPAT 135:305337				
AB	<p>Provided is a process for the prepn. of a pigment dispersion which comprises a pigment surface treatment step of introducing at least one hydrophilic dispersibility-providing group onto the surface of a pigment directly and/or with the interposition of a polyvalent group, and a dispersion step of dispersing a surface-treated pigment obtained at the surface treatment step in an aq. medium, characterized in that the dispersion step involves the dispersion of the surface-treated pigment in admixt. with a wetting agent and water and a resin for providing dispersibility and/or fixability is added during and/or after the dispersion step. Thus, a black ink prepd. from a dispersion comprising surface-treated carbon black pigment 8.0, Joncryl 679 8.0, Surfynol 465 1.0, triethylene glycol monobutyl ether 10.0, glycerin 15.0, 1,5-pentanediol 2.5, triethanolamine 3.0, and water to 100% gave good storage stability and good printing quality, compared to poor storage stability and poor printing quality for a similar compn. without the polymer (Joncryl 679).</p>

AB Comb polymers and macromonomers based on acrylates prepd. by the
ATRP (Atom Transfer Radical Polymn.)
method having improved capability of dispersing **pigments** in the
given solvent can be used in **compns.** comprising the comb
polymers and macromonomers dispersible inorg. or org. **pigment**
particles such as inks, coating materials and be applied to any suitable
substrate, such as metal, wood plastic or ceramic materials. Thus, 5%
comb polymer having improved dispersant performance (formed by the
copolymn. of macromer acryloyl terminated poly(Bu acrylate) and
methacrylic acid) in a alkyd/melamine based coating system can improve
gloss in the final coating and give improved rheol. of the millbase.

AB	A pigment dispersion useful for forming coating compns. contg. dispersed pigment, a non-aq. carrier liq. and an ABC-block polymer dispersant (binder). The ABC block polymer has a no.-av. mol. wt. (Mn) of about 5000-20,000 and contains a polymeric A segment, a polymeric B segment and a polymeric C segment. The polymeric A segment is of polymd. monomers selected from C1-12 alkyl (meth)acrylate monomers, aryl (meth)acrylate monomers, cycloalkyl (meth)acrylate monomers or mixts. of any of the above. The polymeric B segment is of polymd. C1-4 alkylaminoalkyl (meth)acrylate monomers quaternized with an alkylating agent. The polymeric C segment is of polymd. monomers of C1-4 alkyl hydroxyalkyl (meth)acrylate and C1-12 alkyl (meth)acrylate monomers, aryl (meth)acrylate monomers or/and cycloalkyl (meth)acrylate monomers. The block polymer optionally contains polymd. monomers of glycidyl (meth)acrylate or polyalkylene glycol (meth)acrylate. The wt. ratio of pigment to binder in the dispersion is about 1/100-200/100. Thus, prepg. an ABC block copolymer having an A block derived from Bu methacrylate and Me methacrylate, a B block derived from dimethylaminoethyl methacrylate, and a C block derived from Bu methacrylate, Me methacrylate and 2-(trimethylsiloxy)ethyl methacrylate, and quaternizing the resulting block copolymer with benzyl chloride gave a dispersant for pigment dispersion prepn.

AB	Title process for prepn. of water-thinned pigment dispersion as good as oil-based one, comprises (A) kneading by a roller a compn. comprising pigments and a copolymer resin prepd. from two ethylene-type unsatd. monomers [contg. .gtoreq.1 (a) carboxylic and (b) hydroxyl group per mol., resp.] to obtain solid chips, and (B) dispersing the prepd. chips in aq. solvents to give the dispersion. Thus, 14. 1 parts of chips prepd. from C.I. Pigment Blue 15:1 10.0, 40% aq. acrylic acid-Bu acrylate-Et acrylate-2-hydroxyethyl methacrylate-styrene copolymer dimethylaminoethanol salt 6.0, ion-exchanged water 0.2, and Butyl Carbitol 0.2 part, were redispersed with dimethylaminoethanol 0.3, Butyl Carbitol 2.0, and ion-exchanged water 25.0 parts, 41.4 parts of which were mixed with 40% aq. Bu acrylate-Bu methacrylate-Et acrylate-4-hydroxybutyl acrylate copolymer dimethylaminoethanol salt 64.0, methylated melamine Cymel-303 12.2, and ion-exchanged water 7.4 parts to give a water-thinned paint.

- AB Title recording method for providing a good image with excellent adhesion to a recording medium and friction-resistance comprises printing by using an ink **compn.** comprising a colorant, resin emulsion particles, a water-sol. org. solvent and water, and a reacting liq. comprising a reactant producing a coagulation upon contacting with the above ink **compn.** to adhere to a recording medium, wherein the method comprises the steps of making the reacting liq. to adhere to the recording medium, then attaching the ink **compn.** to the medium to print an image, and washing the recording medium printed with a polar solvent. Thus an ink **compn.** comprising (1) a reacting liq. contg. Mg(NO₃)₂.cntdot.6H₂O, triethylene glycol Bu monoether, glycerin, and ion exchanged water, (2) a black ink **compn.** contg. carbon black MA 7, styrene-acrylic acid copolymer, styrene-2-ethylhexyl acrylate-methacrylic acid copolymer-sodium dodecylbenzenesulfonate emulsion, glycerin, and ion exchanged water, and (3) a color ink set contg. cyan, magenta, and yellow inks was prepd. for printing test, showing good image quality and good adhesion to medium after washing and heating.

 PRAI JP 1999-139928 A 19990520
 AB The dispersing agents with good dispersion power are obtained from graft copolymers of 15-98% oligomers with unsatd. ethylene end groups, 1-40% N-contg. polymerizable monomers and 1-70% ether-contg. polymerizable monomers. Thus, polymg. 3-(N,N-dimethylamino)propylacrylamide 4.5, Macromonomer AA 6 (monomethacryloyl-terminated PMMA) 19.5 and NK Ester M 230G (methoxy polyethylene glycol monomethacrylate) 6 in the presence of V 65 (azo radical initiator) 0.12 and 1-methoxy-2-Pr acetate 45 parts gave a graft copolymer, 8.28 g of which was mixed with 8.28 g C.I. Pigment Red 254 and 63.44 g 1-methoxy-2-Pr acetate to give a red color dispersion. Mixing this dispersion 32.4, methacrylic acid/benzyl methacrylate copolymer 9.0, 4-[p-N,N-di(ethoxycarbonylmethyl)]-2,6-di(trichloromethyl)-S-triazine 0.2 and hydroquinone monomethyl ether 0.01 in 1-methoxy-2-Pr acetate 62 part gave a title **compn.**
 ST methacrylate graft copolymer pigment dispersing agent color photosensitive **compn**; photo curable dispersion color filter liq cryst display

AB The polymers are reaction products of (A) polymers of arom. hydrophobic monomers having unsatd. double bonds and monomers having unsatd. double bonds and OH-reactive groups and (B) intermol. condensates of (C10-30 aliph.) oxycarboxylic acids. Pigment **compns.** contg. the polymers and showing excellent water and abrasion resistance are also claimed. Thus, 100 parts styrene-maleic anhydride copolymer (SMA 1000, Mw 6000, acid value 480) was reacted with 103 parts 12-hydroxystearic acid at 80.degree. and dild. with cyclohexanone to give a polymer soln., 100 parts of which was kneaded with carbon black (Black Pearls 800) to give a.

- pigment dispersion showing good storage stability after 1 mo at 60.degree.. Then, the dispersion was applied on a glass plate to give a color coating showing no blistering after 30 min in 80.degree. water and excellent abrasion resistance.
- ST styrene maleic anhydride polymer pigment dispersant; hydroxystearic acid condensate modified polymer dispersant; water resistant coating pigment dispersing polymer; abrasion resistant ink pigment dispersing polymer; oxycarboxylic acid condensate modified styrene polymer
- IT Carbon black, uses
RL: TEM (Technical or engineered material use); USES (Uses)

AB Block copolymers prepd. by living **polymn.** using the **atom**
-**transfer**-radical process are useful for prepn. of dispersions
of (in)org. **pigments** for coatings and inks. A typical block
copolymer was manufd. by **polymn.** of 7 mol Bu acrylate 75 min at 80.degree.
(exotherm 100-105.degree.) in the presence of CuBr, N,N,N',N'',N'''-
pentamethyldiethylenetriamine (I), and Me 2-bromopropionate, and **polymn.**
of 100 mmol 2-dimethylaminoethyl acrylate 80 min at 80.degree. (exotherm
87.degree.) in the presence of CuBr and I.

ST **pigment** dispersant **atom transfer** radical
polymn polymer; pentamethyldiethylenetriamine catalyst

AB	A photocurable compn. comprises (A) 100 parts ethylenically unsatd. group-contg. compd. of which 5-95% is a urethane (meth)acrylate oligomer obtained by the reaction of a polyisocyanate having .gtoreq.3 isocyanate groups with a hydroxyl group-contg. (meth)acrylic acid ester, (B) 0.001-5 parts cationic dye having an absorption max. 400-1200 nm and represented by formula (1) D+.Al-, where D+ represents a cation having an absorption max. 400-1200 nm, and Al- represents an anion, and (C) 0.005-10 parts quaternary borate-type compd. represented by R1-4B-.Z+, where R1-4 = alkyl, aryl, aralkyl, alkenyl, alkynyl, silyl, a heterocyclic group or a halogen, and Z+ represents a cation. A binder for a white coating paint was obtained by polymn. of Sumidur N3500 388, Blenmer AP-400 325, 2-hydroxyethyl acrylate 97, and Aronix M-305 248 parts in the presence of dibutyltin dilaurate.

CC 42-5 (Coatings, Inks, and Related Products)

AB Block and random copolymers of ammonium methacrylate and dimethylaminoethyl methacrylate have been synthesized and tested as dispersants of various org. and inorg. pigments in formulations for waterborne paints. Blockiness of the co-monomer distribution is a prerequisite for good color characteristics in the final paint. A tapered diblock (one-step anionic synthesis), a diblock copolymer with a regular change in compn. from one block to the other one, has interfacial activity quite comparable to the parent "pure" diblock copolymer (two-step anionic synthesis). The most interesting observation is that the poly(dimethylaminoethyl methacrylate) anchoring block can impart stability to dispersion of pigments as different as iron oxide, a blue Cu-phthalocyanine pigment, and a red org. pigment based on pyrrole in representative aq. paint formations.

AB	<p>Pigments are coated with a water-sol. reactive resin which is obtained by reacting neutralized tertiary amine-contg. vinyl copolymers with an .alpha.,.beta.-unsatd. compd. having an epoxy group. Thus phthalocyanine dye Lionol Blue FG 7351 was coated with a water-sol. resin obtained by reacting glycidyl methacrylate with lauryl methacrylate-N,N-dimethylaminoethyl methacrylate copolymer to give a coated pigment of this invention, 40 parts of which was then mixed with 60 parts of polyethylene to give a master batch, 2 parts of which was added to 100 parts of polypropylene. The pigmented polypropylene resin then was fabricated into fibers. The coated pigments have various uses in coatings, inks, and recording materials.</p>

AB The pigments comprise org. pigments treated with dispersants having basic functional groups and inorg. pigments treated with dispersants having acidic functional groups. The coating compns. contain the treated pigments, solvents, and resins. Thus, an org. pigment (P-1) comprised poly(12-hydroxystearic acid) 3.3, Tioxide TR 92 66, xylene (I) 1.6, 2-methoxypropyl acetate (II) 1.6, and 90.0:150.0:155.4:45.2:159.5 Cardura E 10-isophthalic acid-adipic acid-trimethylolpropane-neopentyl glycol copolymer (PE-1) 27.5%. An inorg. pigment (P-6) comprised 19% I, 18% II, 18% a dispersant obtained by reacting 45.1 parts poly(.epsilon.-caprolactone) [prepd. in presence of Ti(Obu)4 and octylic acid] and 15.7 parts 390.0:210.0 glycidyl methacrylate-Bu methacrylate copolymer, 29.2% PE-1, and 15% FW 200 (carbon black). A coating comprising P-1 49.1, P-6 5.5, PE-1 27, U-Van 220 17.9, and Modaflow 0.6% was sprayed onto a Zn phosphate-treated steel plate, flow coated, and baked at 140.degree. to give test pieces showing good adhesion to the substrate (JIS K 5400 8.5.2) and no flooding.

FAN.CNT 1

	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	JP 09171252	A2	19970630	JP 1995-331854	19951220
AB	<p>The title compn. contains (a) a binder resin of a graft copolymer with wt. av. mol. wt. (Mw) 5 .times. 104-1 .times. 106 contg., as a polymer component, .gtoreq.1 macromonomer with Mw 1 .times. 103-2 .times. 104 CHf1:Cf2[XYO(WO)nR61] [f1, f2 = H, halo, CN, hydrocarbon, CO2R1 which may link via hydrocarbons; R1 = H, (substituted) hydrocarbon; X = CO2, OCO, (CH2)1OCO, (CH2)1CO2 (1 = 1-3), O, SO2, CO, CONQ1, SO2NQ1 (Q1 = H, hydrocarbon), CONHCO2, CONHCONH, C6H4; Y = linking group; (WO) indicates a repeating unit; n = 1-3, when n .gtoreq. 2, W is different from the W in the adjacent unit (WO); W = CHr1CHr2 (r1, r2 = H, alkyl), (CH2)4; R61 = H, hydrocarbon, COR62 (R62 = hydrocarbon)], (b) a radiation-sensitive compd., and (c) a pigment. The pigment is dispersed well as fine particles in the compn., and the compn. shows good coatability and provides high quality color filters. Thus, a radiation-sensitive compn. was prepd. by using graft copolymer HOOC(CH2)2CMe(CN) [{CH2CMe(CO2CH2Ph)}80{CH2CMe(CO2CH2CH2OH)} 20], dipentaerythritol pentaacrylate, 4-[o-bromo-p-N,N-di(ethoxycarbonyl)aminophenyl]-2,6-di(trichloromethyl)-s-triazine, 7-[(4-chloro-6-(diethylamino)-s-triazin-2-yl)amino]-3-phenylcoumarin, C.I. Pigment Red 155, and C.I. Pigment Yellow 83.</p>

AB	Title compns. , useful as coatings, adhesives, sealants, resists, etc., comprise pigments coated by copolymers composed of vinyl acetate and CH ₂ :CR1CO2CH2CHR2OH (R1, R2 = H, Me), water-sol. acrylic resins, and water-sol. diazo resins. Thus, 100 parts blue pigment dispersion composed of cyanine blue 95, dioxazine violet 5, polyoxyethylene monooleyl ether 20, and H ₂ O 380 parts was treated with vinyl acetate 1, 2-hydroxypropyl methacrylate 2.3, and benzoyl peroxide 0.03 part at 80.degree. for 8 h to give a reaction mixt., 50 parts of which was blended with 4.5 part 10% diazo resin soln. and 50 parts acrylic resin soln. (prepd. by polymn. of 2-hydroxyethyl methacrylate 80, methacrylamide 10, dimethylacrylamide 9, and acrylic acid 1 part in aq. AcOH) to give a photosensitive soln. Then, the soln. was spin-coated on a glass paste, irradiated by UV, and developed by a soln. contg. anionic surfactant and malic acid to give photomask.

AB	The title polymers, having wt.-av. mol. wt. 5000-10,000, polydispersity .ltoreq.2.2, and good compatibility with coating resins, are prepd. by dropwise addn. of mixts. of C1-4 alkyl (meth)acrylates, C6-20 alkyl (meth)acrylates, and radical initiators to org. solvents (m. 75-150.degree.) at a temp. below the solvent m.p. in a pressurized (1-10 atm) reactor. A copolymer was prepd. from a mixt. of Me methacrylate 65, iso-Bu methacrylate 10, dodecyl methacrylate 18, 2-hydroxyethyl methacrylate 7, and methacrylic acid 1 part by using tert-butylperoxy isobutyrate as the initiator and a 30:70 AcOBu-xylene mixt. as the solvent. A compn. contg. the copolymer and an oil-modified alkyd resin gave a transparent coating.

AB Coating systems for plastics and metals comprise primers contg. nonacid-catalyzed thermoplastic polymers with min. film-forming temps. (MFFT) 10-55.degree. C and top coatings contg. 52-78.5% aq. dispersions of polymers from functional and nonfunctional group-contg. monomers, 1.5-8% nonionic surfactants for stability of the dispersion at pH 1.0-10, and 20-40% substituted amides (optionally alkoxyated or etherified) or their mixts. with highly alkylated polymeric methoxymethylated substituted amines (optionally alkoxyated or etherified). Thus, a slurry contg. water 36, Bu Carbitol 12, iso-PrOH 12, poly(vinyl pyrrolidone) 21, and amphoteric sulfonated surfactants 6, ethoxylated octylphenol (I, ethylene oxide content 40 mols.) 2, deformer 4, SiO2 88, TiO2 20, methoxymethylurea [9011-05-6] 107, and org. wax 12 g was mixed with sufficient water for proper grinding viscosity, stirred 10 min to effect a 6+ Hegman grind, and letdown with 400 g 40% solids copolymer (II) [97972-64-0] emulsion prepd. from acrylamide 26, methacrylic acid 11, styrene 49, Me methacrylate 50, Bu methacrylate 180, hydroxyethyl methacrylate 21, and Et acrylate 37 g in the presence of methoxylated nonylphenyl (ethylene oxide content 6 and 40 mols). This compn. was neutralized with 2 g dimethylethanolamine, and mixed with 70% p-toluenesulfonic acid to pH

1.5-2.5 to give a top coating **compn.** Steel, Al, polyester, Lexan polycarbonate, Noryl [52439-05-1], polystyrene [9003-53-6], and ABS polymer [9003-56-9] were primed with a **compn.** contg. 185 g mixt. (MFFT 45.degree. C) of 2 acrylic polymer emulsions, 50 g glycol ether, 2 g NH4OBz, 23 g water and a **pigment** slurry contg. Bu Cellosolve 30, water-solubilized emulsions (MFFT 20-30.degree. C) 26, 23% aq. NH3 1, amine 1, alk.-neutralized maleic anhydride-isobutylene adduct 6, ethoxylated I (ethylene oxide content 9-40 mols.) 4, defoamer 2, ZnO 9, TiO2 140, Zn molybdate 35, mica 17, Mg silicate 23, SiO2 16, and acrylic polymer emulsions (MFFT 47-57.degree. C) 350 g, air-dried 15 mins., baked 5 min at 150.degree. F, overcoated with the II topcoating **compn** ., and baked 30 mins at 150.degree. F to give a 1.5-mil topcoating with Gardner 60.degree. gloss 17, Eagle pencil hardness H, Gardner direct impact strength 80 in.-lbs, elongation 4.5% on a 1/in. conical mandril, and 1,1,1-trichloroethane resistance 50 double rubs.

	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	JP 54046235	A2	19790412	JP 1977-112949	19770920
	JP 60034590	B4	19850809		
AB	Substrates are coated with compns. contg. melamine-formaldehyde copolymer (I) [9003-08-1], thermosetting resins, and powd. metal and top coated with surfactant-contg. thermosetting resin compns. having a surface tension at least 0.5 dyne/cm lower than that of the previous coatings to prevent crack formation during drying. Thus, a primed steel plate was coated with a compn. (surface tension 27.6 dyne/cm) contg. 50% solids 2:20:20:13:15:30 acrylic acid-Bu methacrylate-Et acrylate-2-ethylhexyl acrylate-2-hydroxyethyl methacrylate-Me methacrylate copolymer [71166-37-5] soln. 160, 50% solids I soln. 40, powd. Al 12, yellow pigment 0.01, carbon black 0.005, PhMe 40, petroleum solvent 30, BuOAc 20, and BuOH 10 parts, left 3 min, and top coated with a compn. (surface tension 26.5 dyne/cm) contg. 50% solids 2:30:23:15:30 acrylic acid-Bu methacrylate-2-ethylhexyl methacrylate-2-hydroxyethyl methacrylate-styrene copolymer [55774-94-2] soln. 140, 60% solids I soln. 50, petroleum solvent 90, BuOH 10, and fluorine-contg. surfactant 0.01 part. When the fluorine-contg. surfactant was omitted, a similar top coating compn. had surface tension 28.5 dyne/cm and formed cracks during drying.				
ST	metallic coating compn. ; acrylic polymer coating steel; melamine resin coating steel; surface tension coating compn. ; crack prevention coating steel; surfactant top coating steel

AB	The title compns. , free of dispersants, essentially free of org. solvents, and contg. 20-80% solids, contain NH3- or amine-neutralized CO2H-contg. polymers, pigments or fillers, and, optionally, crosslinking agents. Thus, a mixt. of 50% BuOH soln. of 6:20:14:50:55 acrylic acid-N-(butoxymethyl)methacrylamide-ethyl acrylate-hydroxypropyl acrylate-methyl methacrylate copolymer [60766-06-5] 1000, Me2NCH2CH2OH 10, and TiO2 500 parts was ball-milled, and BuOH was distd. azeotropically at 94-8.degree. to give a 40% solids dispersion, viscosity 230 cP. Spraying this compn. on degreased, unprimed, deep-drawing sheet and baking 30 min at 150.degree. gives a highly glossy, hard, elastic coating.
